Non-Loseable Bonus Manager

Windows-based bonus management with CRM API integration

Bonus programmes. Built around your brokerage.

Two bonus-observation modes. Broker-defined programme rules. Connected to your CRM.

Two modes.
One broker-led approach.

Provide bonus credit for MT5 accounts and apply the observation mode that fits your programme.

Super Bonus mode

Set a threshold as a percentage of the deposit. When the configured threshold is reached, the manager closes positions and disables trading.

Proportional Deduction mode

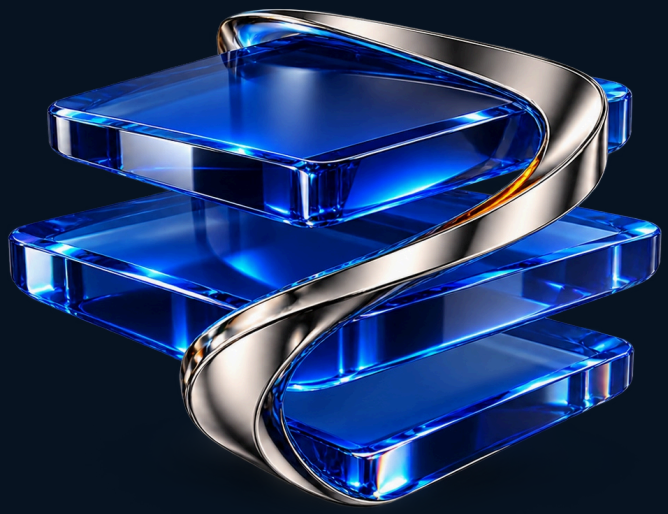

Link bonus-credit reduction to the reduction in account balance following position closure, maintaining the proportion shown in your configured programme.

Windows version. APIs are supplied for CRM integration. Bonus issuance can be initiated through the CRM at any point.

paperbot

Handcrafted for your business.

Thoughtful technology.
A more connected brokerage experience.

Technology shaped around your operations

Paperbot brings design, technology and service together around the way your business works. We consider the operational purpose of each tool, the people using it and the experience your brand wants to create.

A focused addition to your brokerage

This manager brings bonus observation and CRM connectivity into a defined product. Its purpose is clear: help the broker offer bonus programmes and apply the selected account rule through a Windows-based MT5 solution.

From bonus issuance to the selected rule.

Your CRM initiates the bonus. The manager observes the account and applies the selected mode.

01

Initiate

Start the bonus through the CRM whenever required.

→

02

Observe

Monitor the account under the selected bonus mode.

→

03

Apply

Execute the action defined by that mode.

Broker-led initiation

The broker determines when its CRM initiates a bonus, so the initiation logic can follow the programme requirements and the client workflow.

Two distinct observation paths

Super Bonus uses a configured deposit-based threshold. Proportional Deduction adjusts bonus credit in relation to the reduced balance following position closure.

Two bonus modes. Distinct observation and action logic.

A defined threshold.
A defined account action.

Super Bonus mode observes the account against a threshold configured as a percentage of the deposit.

Set the programme threshold

The broker configures the percentage around the programme requirements. The threshold can be set to values such as 1%, 2%, 3% or 5% of the deposit.

Apply the threshold action

When the configured threshold is reached, the manager closes positions and disables trading. This is the account action for Super Bonus mode.

The percentage describes the deposit-based observation threshold; it is distinct from the bonus percentage granted to an account.

Your deposit reference. Your programme setting.

Configure the observation threshold as a percentage of the deposit.

Example deposit reference

USD 100 deposit

1%	2%	3%	5%
USD 1	USD 2	USD 3	USD 5

A clear basis for configuration

The deposit is the reference for the threshold percentage. The amounts above show how selected percentages translate for an illustrative USD 100 deposit.

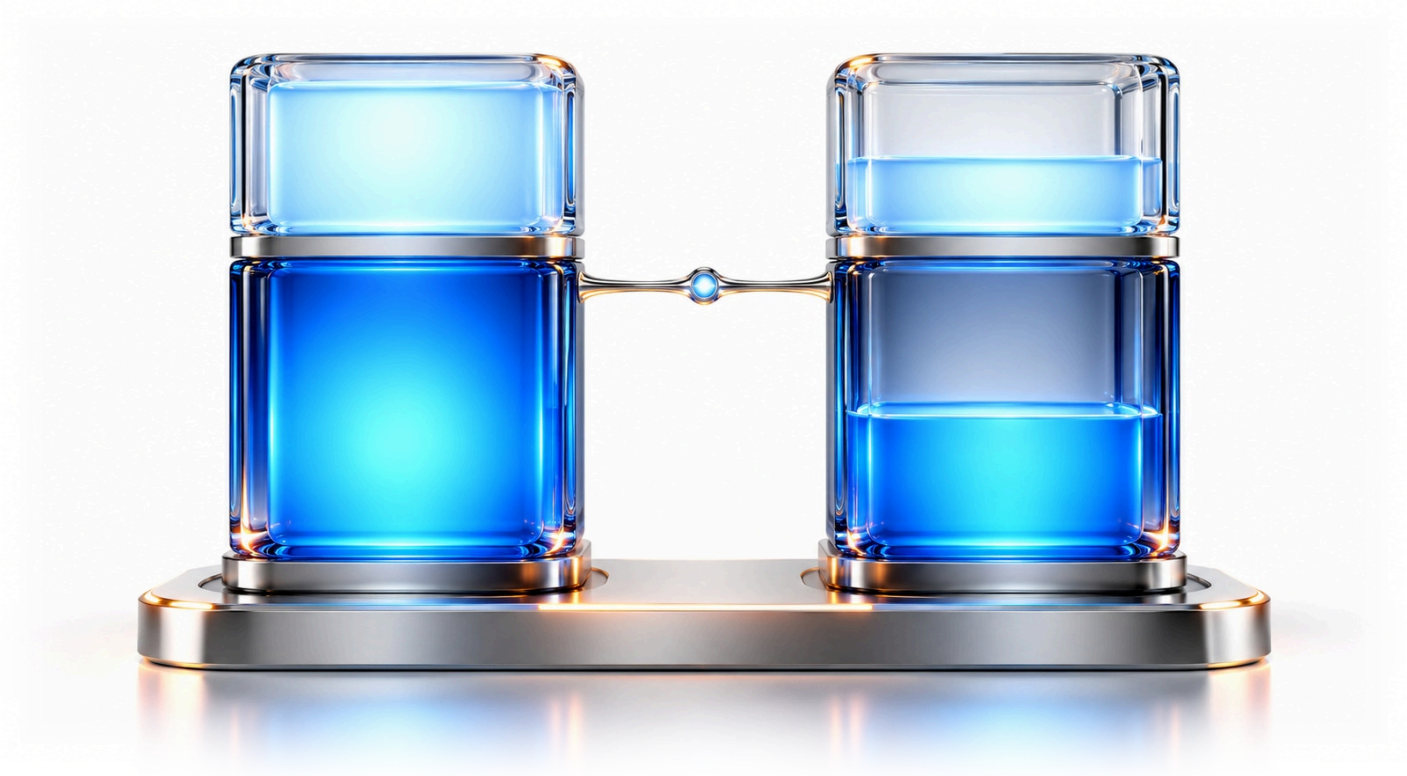

A consistent action when reached

Reaching the configured Super Bonus threshold triggers position closure and disables trading. The selected percentage is configured to the broker's programme requirements.

Illustrative threshold-setting amounts. These percentages are not the bonus-credit allocation rate.

Credit that follows the balance reduction.

Proportional Deduction mode adjusts bonus credit in relation to a reduced account balance following position closure.

Reduce credit in the same proportion

A change in balance is reflected proportionally in the bonus credit. In the supplied example, halving the balance from USD 100 to USD 50 reduces bonus credit from USD 400 to USD 200.

A different observation mechanism

This mode explains credit adjustment through the balance relationship, rather than using the Super Bonus threshold action as its deduction mechanism.

The worked example illustrates a balance reduction. Other programme-event rules are confirmed during configuration.

One example.
A clear proportion.

A 400% bonus allocation on a USD 100 balance creates USD 400 of bonus credit.

Initial account

Account balance

USD 100

Bonus credit

USD 400

After balance reduction

Account balance

USD 50

Bonus credit

USD 200

Balance reduced by 50%

The example account balance moves from USD 100 to USD 50 following the trading activity described.

Credit reduced by 50%

Bonus credit moves from USD 400 to USD 200, maintaining the same balance-to-credit proportion in this example.

Illustrative account values for a 400% bonus allocation.

Choose the mechanism for your bonus programme.

Both modes support broker bonus programmes, with different observation and action logic.

Super Bonus

Observation basis

Threshold configured as a percentage of the deposit

Account action

Close positions and disable trading when the threshold is reached

CRM initiation

Configurable; the CRM can initiate a bonus at any point

Proportional Deduction

Observation basis

Balance reduction following position closure

Account action

Reduce bonus credit in the corresponding proportion

CRM initiation

Configurable; the CRM can initiate a bonus at any point

Keep the programme clear

Select the mode around the account behaviour the broker intends to apply. The programme description should make the bonus allocation and the selected mechanism easy to understand.

Connect bonus workflows to your CRM.

Integration APIs are provided so bonus functionality can connect with the broker's CRM.

APIs for the integration

Paperbot supplies the APIs needed for CRM integration. The connection brings bonus initiation into the CRM workflow while the manager performs its configured account observation.

Configure the initiation logic

The broker configures when its CRM initiates a bonus, matching initiation to the intended programme and client workflow.

Integration details are reviewed against the broker's CRM and MT5 environment.

A Windows application. An MT5 bonus workflow.

The manager is provided as a Windows version for MT5 bonus operations.

Windows-based operation

The deployment approach is reviewed around the broker's Windows environment and the MT5 setup the manager needs to work with. Platform details are confirmed as part of the technical discussion.

Connected to the business workflow

CRM API integration provides the link to bonus initiation. The selected observation mode defines how the manager responds as the account reaches the applicable programme condition.

Deployment specifications and integration arrangements are confirmed for the intended environment.

Initiate when your programme requires.

The CRM controls when a bonus is initiated; the manager applies the chosen observation logic.

Configurable timing

The broker can configure the initiation logic through its CRM and initiate a bonus at any instance. This gives the CRM a central role in the bonus workflow.

Programme-specific operation

Bonus allocation and the selected observation mode are discussed around the programme requirements. The manager then follows the applicable threshold or proportional-deduction mechanism.

Concept illustrations throughout this brochure explain the product; they are not screenshots of a live interface.

A focused product.
A considered configuration.

Bring your intended bonus programme and integration environment into one practical discussion.

01

MT5 environment

Confirm the target MT5 setup and account context.

02

Windows deployment

Review the operating environment for the Windows version.

03

CRM connection

Identify the CRM workflow that will initiate the bonus.

04

Bonus mechanism

Select the observation mode, bonus allocation and applicable deposit-based threshold.

Review the programme with Paperbot

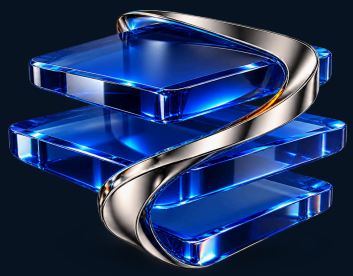

Share the account behaviour you want to apply and the CRM workflow you want to connect. We will review the product with you and discuss the configuration, integration scope and quotation.

Your bonus programme. Your brokerage.

Non-Loseable Bonus Manager for MT5, with Windows-based operation, CRM integration and two observation modes.

Let's discuss your programme

Tell us how you want to offer bonus credit and which account mechanism fits your operation. We will walk you through the product and review the integration and configuration requirements.
